AI-Powered Discovery Engine

Before proposing any solution, build an AI-powered system that analyzes user feedback and conversations about photo retrieval at scale.

You may use:

- Claude
- GPTs
- Agents
- Workflows
- RAG
- n8n
- Zapier
- Perplexity
- Any AI-native stack of your choice

Analyze publicly available sources such as:

- Google Play Store reviews
- App Store reviews
- Reddit discussions
- Google Photos community/support discussions
- Social media conversations
- YouTube comments
- Forums and other relevant public discussions

Your discovery engine should help uncover questions like (sample questions only):

- *What kinds of old photos do users struggle to retrieve?*
- *What information do people actually remember about a photo?*
- *What information have they forgotten?*
- *How do users formulate searches when their memory is incomplete?*

Your workflow should go beyond summarizing reviews or performing sentiment analysis.

It should enable you to **identify and compare different retrieval problems and opportunity areas** using evidence from real users.
